

Markdown Extraction Test

This document checks whether a PDF extractor can recover ordinary Markdown structure without relying on complex Carve features.

Text can be **bold**, *italic*, or ***bold and italic***. It can also contain a [visible link](#).

The extended formatting line contains underlined text, highlighted text, superscript^{note}, and subscript_{index}.

Paragraphs

This is the first paragraph. It wraps across more than one visual line in the PDF, but it should remain one paragraph in the extracted Markdown.

This is a separate paragraph. The vertical space above it should prevent both paragraphs from being merged.

Lists

- First unordered item
 - Second unordered item
 - Third unordered item
1. First ordered item
 2. Second ordered item
 3. Third ordered item

Blockquote

Good extraction preserves the quotation as a blockquote instead of flattening it into an ordinary paragraph.

Code

```
function greet(string $name): string {
    return "Hello, {$name}!";
}
```

Simple table

Region	Revenue	Growth
North	1,240	13.7%
South	980	4.1%
Total	2,220	9.5%

Literal punctuation

The next lines are literal text, not Markdown constructs:

not a heading

- not a list item

not emphasis, _not emphasis_, [not a link], 2 | 3, C:\docs\file, and a `backtick`.

Image

The image above uses standard Markdown image syntax with useful alternative text.
